

MetTel Total Business Solutions

MetTel offers a comprehensive, cost-competitive suite of integrated communications services designed to enhance your business operation and increase profitability.

MetVoice™ Services

MetVoice™ Business Lines

Enables efficient, reliable communication with your customers, employees and suppliers. Provides connectivity for incoming and outgoing calls with access to local, regional and long distance calling as well as fax and Internet services. Utilizes our state-of-the-art, technologically advanced digital network, which offers exceptional service delivery. Experience optimal, crystal-clear connections from start to finish, whether you are calling around the corner or around the world. Benefit from our broad portfolio of call management features.

MetVoice™ Digital Centrex Service

Realize true power and performance with our cutting-edge Digital Centrex service, which utilizes the power of the MetTel network to provide flexible, economical and scalable voice communications solutions. Businesses of every size gain quantifiable benefits from a variety of standard and optional features that allow you to effectively and efficiently manage calls.

MetVoice™ PBX Trunk Services

Offers a complete portfolio of analog trunk side connections between your PBX and the MetTel network. Callers can directly dial anyone in your company without having to go through a third-party attendant. Select the number and type of trunks you require to reduce costs.

MetConnect™ Internet Access Services

MetConnect™ DSL Services

Provides reliable high-speed data access and transmission over existing copper telephone lines. Because you are Web-enabled, everything from Email to Ecommerce is handled at the computer. Utilize your DSL and phone line simultaneously for real-time communication faster and cheaper. Choose the rate of transmission and services best suited to your data communications and business requirements.

MetTel Total Business Solutions

MetPath™ Advanced Voice & Data Services

MetConnect™ Internet T1/T3 Services

Enjoy reliable, secure and highly available data transmissions with T1 and T3 services. Our T1 service offers connectivity at 1.544Mbps; our T3 service is the equivalent of 28 T1 circuits at 45 Mbps. Expedite downloads and file transfers while allowing for multiple users to share a single facility using PC or LAN applications.

MetPath™ Private Line Service

Provides a family of private line services that support both voice and data applications. These leased lines offer a dedicated point-to-point facility (i.e., not part of a public switched network) between specific locations. Gain exclusivity as well as the level of privacy, security and availability your company requires.

MetPath™ Integrated T1

MetPath™ Integrated T1 is an enhanced offering that enables businesses to combine traditional voice services with high-speed Internet access. Voice service includes either T1/PRI or business line connectivity with an optional Internet Protocol interface available. Bandwidth is dynamically allocated as user needs change.

MetPath™ Digital PBX Service

MetPath™ Digital PBX Service delivers a high speed DS1(T1) connection between your PBX and the MetTel network, offering a cost-competitive alternative to analog PBX service. Configure trunk groups to provide inbound, outbound or two-way traffic utilizing software instead of labor-intensive hardware changes to your PBX.

MetPath™ ISDN BRI & PRI Services

MetPath ISDN Services are digital access technologies that allow simultaneous, integrated voice and data capabilities. ISDN BRI (Basic Rate Interface) uses standard twisted pair cables and is nearly three times faster than a 56K dial-up line. ISDN PRI (Primary Rate Interface) uses a 1.544 Mbps digital transport facility (T1) and features 23 B channels and one D channel that are delivered over the T1. Both provide superior clarity of digital transmission, high-speed data interfaces and sufficient bandwidth capacity.

MetPath™ Frame Relay Services

High-performance packet data network that is a cost-efficient means of providing connectivity among geographically dispersed corporate local area networks (LANs). It's a more cost-effective alternative to private line services due to its deployment over a closed network.
